## SUMMARY

---

.NET software engineer who works across the stack, from C# microservices and REST APIs down to the SQL and CI/CD that keep them running. Most of what I build runs on systems people depend on daily, including the platform behind roughly 80% of company order entry. I own a service end to end and fix production issues under pressure. I've also coordinated the teams behind a legacy API rewrite and a new CRM environment.

## SKILLS

---

**Languages:** C#, SQL, PowerShell, Bash, JavaScript, Python, Java, HTML/CSS

**Frameworks & Libraries:** .NET (ASP.NET, MVC, Blazor, MAUI, EF, MVVM), Spring Boot, React.js, Node.js, Tailwind CSS, Bootstrap

**Cloud & Tooling:** Azure DevOps, Azure Key Vault, Application Insights, AWS, IIS, SQL Server, Swagger/OpenAPI

**Practices:** Microservice & BFF architecture, REST API design, CI/CD pipelines, token-based auth, unit & functional testing, Agile/Scrum, code review

## EXPERIENCE

---

### Software Engineer, Kimball Midwest

Feb 2026 – Present

Columbus, OH

- Stood up the "Thrive" dev and UAT environment for MSTARs, our order entry app, as it migrated to Dynamics 365: got new SQL Server instances, pipelines, hosts, and firewall rules provisioned while coordinating DBAs, DevSecOps, Systems Engineering, and integration partner VelSol. Both sides are now making cross-system calls.
- Pushed back on deploying duplicate v10 controllers for the migration and argued for forking at the branch level instead. With no automated end-to-end coverage on the VelSol data syncs, redeploying the existing codebase to a separate host was lower risk and left far less to maintain.
- Rewrote MSTARSApi, a ten-year-old .NET Framework service, into MSTARs.Client.Api on modern .NET. Added token-based auth, moved logging into Application Insights, and introduced unit and functional tests where there had been none. The service backs about 80% of company order entry.
- Kicked off my part of the .NET 8-to-10 upgrade: moved shared libraries onto stable package references and documented the path for the remaining ~84 applications.
- Took over the CI/CD pipeline and release process for the Managers App and cleared the Telerik licensing and NuGet authentication failures that were breaking builds.

### Associate Software Engineer, Kimball Midwest

Jun 2024 – Feb 2026

Columbus, OH

- Built and owned ManagersAppClient.api, a backend-for-frontend service that pulls together around 15 downstream microservices (Search, Company, SalesRep, Person, and others) behind a single API for a manager-facing reporting app used by 200+ people.
- Inherited the Managers App after a vendor handoff, refactored it to MVVM, and added the Field Visit Reports and Business Reviews modules. Those replaced a tangle of Excel sheets, Microsoft Forms, and PowerApps that had never captured the data cleanly.
- Ran iOS and Android releases for the app and documented the process so teammates could pick it up.
- Replaced legacy vendor code, cutting a third-party dependency.
- Handled production support across MSTARs to keep order entry running, and wrote unit and functional tests that made the deployment pipeline more reliable.

### Help Desk Agent, Tier 1, Kimball Midwest

Mar 2023 – Jun 2024

Columbus, OH

- Worked IT and mobile-app tickets through KACE and wrote PowerShell scripts to automate the repetitive ones.
- Pulled ticket data in SQL to spot recurring problems and translated between business units and IT.

## EDUCATION & CERTIFICATIONS

---

**B.S. Computer Science**, Franklin University (2023) — capstone: Post Mortem, a horror-media discussion platform built with Blazor and hosted on Azure

**A.S. Software Development**, Columbus State (2020)

Microsoft Certified: Azure Fundamentals (AZ-900) — 2024

CompTIA IT Fundamentals+ — 2024
