SUMMARY

Full-stack engineer who moves easily between C#, SQL, and modern JavaScript, with a genuine interest in how systems are designed to fit together. I like being handed problems I haven't solved before, and I'm usually the one coworkers loop in when they're not sure who else to ask. I own what I build end to end and stay steady fixing it under pressure. Lately that's meant coordinating the people and systems behind a legacy platform's transition to a new CRM.

SKILLS

Languages: C#, SQL, PowerShell, Bash, JavaScript, Python, Java, HTML/CSS

Frameworks & Libraries: .NET (ASP.NET, MVC, Blazor, MAUI, EF, MVVM), Spring Boot, React.js, Node.js, Tailwind CSS, Bootstrap

Cloud & Tooling: Azure DevOps, Azure Key Vault, Application Insights, AWS, IIS, SQL Server, Swagger/OpenAPI

Practices: Microservice & BFF architecture, REST API design, CI/CD pipelines, token-based auth, unit & functional testing, Agile/Scrum, code review

EXPERIENCE

Software Engineer, Kimball Midwest

Feb 2026 – Present

Columbus, OH

- Stood up the "Thrive" dev and UAT environment for MSTARs, our order entry app, as it migrated to Dynamics 365: got new SQL Server instances, pipelines, hosts, and firewall rules provisioned while coordinating DBAs, DevSecOps, Systems Engineering, and integration partner VelSol. Both sides are now making cross-system calls.
- Pushed back on deploying duplicate v10 controllers for the migration and argued for forking at the branch level instead. With no automated end-to-end coverage on the VelSol data syncs, redeploying the existing codebase to a separate host was lower risk and left far less to maintain.
- Rewrote MSTARSApi, a ten-year-old .NET Framework service, into MSTARs.Client.Api on modern .NET. Added token-based auth, moved logging into Application Insights, and introduced unit and functional tests where there had been none. The service backs about 80% of company order entry.
- Kicked off my part of the .NET 8-to-10 upgrade: moved shared libraries onto stable package references and documented the path for the remaining ~84 applications.
- Took over the CI/CD pipeline and release process for the Managers App and cleared the Telerik licensing and NuGet authentication failures that were breaking builds.

Associate Software Engineer, Kimball Midwest

Jun 2024 – Feb 2026

Columbus, OH

- Built and owned ManagersAppClient.api, a backend-for-frontend service that pulls together around 15 downstream microservices (Search, Company, SalesRep, Person, and others) behind a single API for a manager-facing reporting app used by 200+ people.
- Inherited the Managers App after a vendor handoff, refactored it to MVVM, and added the Field Visit Reports and Business Reviews modules. Those replaced a tangle of Excel sheets, Microsoft Forms, and PowerApps that had never captured the data cleanly.
- Ran iOS and Android releases for the app and documented the process so teammates could pick it up.
- Replaced legacy vendor code, cutting a third-party dependency.
- Handled production support across MSTARs to keep order entry running, and wrote unit and functional tests that made the deployment pipeline more reliable.

Help Desk Agent, Tier 1, Kimball Midwest

Mar 2023 – Jun 2024

Columbus, OH

- Worked IT and mobile-app tickets through KACE and wrote PowerShell scripts to automate the repetitive ones.
- Pulled ticket data in SQL to spot recurring problems and translated between business units and IT.

EDUCATION & CERTIFICATIONS

B.S. Computer Science, Franklin University (2023) — capstone: Post Mortem, a horror-media discussion platform built with Blazor and hosted on Azure

A.S. Software Development, Columbus State (2020)

Microsoft Certified: Azure Fundamentals (AZ-900) — 2024

CompTIA IT Fundamentals+ — 2024
